West Wide Corridor DEIS
Argonne National Laboratory
9700 S. Cass Avenue
Building 900, Mail Stop 4
Argonne, IL 60434

January 9, 2008

To Whom It May Concern:

I would like to express my support for the designation of two additional energy corridors as part of
the West Wide Corridor designation process.

a) Corridor from Garrison, Montana south past Mill Creek Substation to the Dillon, Montana
area.

b) Corridor from a point along existing 500 kV transmission lines near Townsend, Montana
to the Mill Creek Substation.

The expanded use of these two corridors present major opportunities for the region and for the
overall security of the western United States utility grid.

The above referenced routes are significantly less environmentally sensitive than other areas of
the state. These routes run parallel to existing infrastructure currently owned by Northwestern
Energy or Bonneville Power Administration which previously served the Anaconda Copper Mining
Company Smelter located in Anaconda, Montana. By constructing adjacent to existing industrial
infrastructure, pristine lands in other areas can remain so while still providing the avenues for
upgrading and constructing the necessary electrical systems. The designation of these routes
through less sensitive areas expedites any developer’s potential plans, decreasing costs and
timeframes.

Thank you for the opportunity to comment.

Sincerely,

Peter J. Rodovich

To Whom It May Concern:

I would like to express my support for the designation of two additional energy corridors as part of the West-Wide Corridor designation process:

a) Corridor from Garrison, Montana south past Mill Creek Substation to the Dillon, Montana area.

b) Corridor from a point along existing 500 kV transmission lines near Townsend, Montana to the Mill Creek Substation.

The expanded use of these two corridors present major opportunities for the region and for the overall security of the western United States utility grid.

The above referenced routes are significantly less environmentally sensitive than other areas of the state. These routes run parallel to existing infrastructure currently owned by Northwestern Energy or Bonneville Power Administration which previously served the Anaconda Copper Mining Company Smelter located in Anaconda, Montana. By constructing adjacent to existing industrial infrastructure, pristine lands in other areas can remain so while still providing the avenues for upgrading and constructing the necessary electrical systems. The designation of these routes through less sensitive areas expedites any developer’s potential plans, decreasing costs and timeframes.

Thank you for the opportunity to comment.

Sincerely,

Marilyn R. St. Pierre

I would like to express my support for the designation of two additional energy corridors as part of the West-Wide Corridor designation process.

a) Corridor from Garrison, Montana south past Mill Creek Substation to the Dillon, Montana area.

b) Corridor from a point along existing 500 kV transmission lines near Townsend, Montana to the Mill Creek Substation.

The expanded use of these two corridors present major opportunities for the region and for the overall security of the western United States utility grid.

The above referenced routes are significantly less environmentally sensitive than other areas of the state. These routes run parallel to existing infrastructure currently owned by Northwestern Energy or Bonneville Power Administration which previously served the Anaconda Copper Mining Company Smelter located in Anaconda, Montana. By constructing adjacent to existing industrial infrastructure, pristine lands in other areas can remain so while still providing the avenues for upgrading and constructing the necessary electrical systems. The designation of these routes through less sensitive areas expedites any developer’s potential plans, decreasing costs and timeframes.

Thank you for the opportunity to comment.

Sincerely,

Mark Wondra
