To Whom It May Concern:

Anaconda Local Development Corporation would like to go on record as to the designation of two particular energy corridors as part of the West-Wide Corridor designation process and to adopt two philosophies in the decision matrix.

The philosophies we would ask you to adopt are

- a) Adopt corridors on federal lands
- b) Utilize existing corridors and routes.
- c) Utilize The Mill Creel sub-station area as a major component and hub to the system

With those philosophies in mind we support the addition of two corridors to the system

- a) Garrison, Montana south past Mill Creek substation to Dillon Montana
- b) Corridor from Townsend Montana along the existing 500 kV transmission line to the Mill Creek Substation.

The above reference routes reduce environmental impacts, utilize existing infrastructure and supports devastated economies.

Sincerely,

James H. Davison
Executive Director

To: Representative Dan Villa,

On regard to the Energy Corridor to be built to handle power moving from Colstrip's 500 KV transmission lines to transmission lines in southern Idaho, I support having the line run in my county of Anaconda/Wheeler County. This can be done by using North-Western Energy's two proposed possible routes!

Re: Proposed energy corridor in the Western United States.

Dear Dan,

Deer Lodge County must be considered as a viable route for the MSTI line, as it is already an existing corridor running south from Garrison Montana.

The existing Garrison route is economically feasible and it would have the least environmental impact.

I am supporting the Garrison route through Deer Lodge County and hope you will express my support during your upcoming meeting.

The transmission line should go through Deer Lodge county. It's simply a no brainer in terms of environmental impact and economical advantages for both the county and those with other interests in the project.
It's about time this county gets something of value instead of everybody elses toxic wastes.
