West-wide Energy Corridor DEIS  
Argonne National Laboratory  
9700 S. Cass Ave., Building 900, Mail Stop 4  
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Harriet jernquist

9700 S. Cass Ave., Building 900, Mail Stop 4  
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Paula Johnson  
616 South Stuart Road

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Amy Knight

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Jennifer Gardner

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Laurabeth Albright

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Deanna Gianopoulos

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
S. Chapek

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Nancy Pernell

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Harry and Jill Brownfield

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Russell Bezette

Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
B. ROCCO DEL GIGLIO

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
carol blazier

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Jeff Troxel

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Daniel Bachmann II

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
carolyn VANINI

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Elizabeth Leaf

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Andria Herron

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Paul Sullivan

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Callie Riley

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Leslie Yost  
537 North Mission Drive

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Kim Brown

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Lena Jennings

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Emily Owens

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Kristi Annecone

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Dr. Edward Kush

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Bridget Farrell

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Lindsay Mugglestone

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Rhoda Rostky

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Karen Eble

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Mickey McConnell

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Elaine Anderson

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
J White

West-wide Energy Corridor DEIS  
Argonne National Laboratory  
9700 S. Cass Ave., Building 900, Mail Stop 4  
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Bill Cadogan

West-wide Energy Corridor DEIS  
Argonne National Laboratory  
9700 S. Cass Ave., Building 900, Mail Stop 4  
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Rhonda Johnson

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Lindsey Baldewicz

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Lori Widelitz-Cavallucci

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Susan Skvarla

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Patricia Bordewieck

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Robin McLean

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
David Romano

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Jean Nadeau

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Laina Shockley

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.  
Thank you.

Sincerely,  
Carol Keiter
