West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Susan Reddish

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
A Canonico

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
H Thomas Blum

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Evelyn Jordan

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Elana Katz

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Emma Sandon

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Gordon Long

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Lindsey King

Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Gina Ventola

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Leonard Bruckman

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
David Wahl

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
constance rodman

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joline Gitis

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Peter Caton

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Carrol Vore

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Barbara Puett

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Eric Durante

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
David Neumann

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
cynthia Madrid

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Sherry Marsh

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joy Nelson-Calhoun

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
James Carlson

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jennifer Bieth

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Michele Westmoreland

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Matthew Cloner

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jeffrey Carr

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Raphael Montoliu

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Thomas Stark

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Carola Hakkert

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Ken Mundy

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Holly McDuffie

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Sallie Light

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Betty Gentry-Metzler

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Marianne Trautman

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
George Buckingham

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
David Hughes

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Brent Hepner

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Brian Healy

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Roberta Marley-Merchant

- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Steve Arnold

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Katherine Borghardt

Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Matthew Swyers

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Mathew Christianson

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joe Loree

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Robert Wagner

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Michael Byrnes

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Stephanie S

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Julie Henderson

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Peter Hand

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors.
