West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Yahanna Faith-Smith

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Terri Douglass

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
John Douglas

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Raymond Carreau

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Anthony Bell

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Noel Murray

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Mark Donaldson

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Cara D'Amico

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Judy Peter

Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Kathleen Leslie

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Kevin Soles

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
George Mierisch

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joann Sustachek

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
jill cresko

- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joyce Pritchard

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;

- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Lily Witham

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Terril Tompkins

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Twila Friberg

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Elin Defrin

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Harold Robinson

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Paul Statman

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
gabrielle nevitt

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Nancy Carroll

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Tony Inkel

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
joseph trimarco

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jeremiah Kidd

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Shirley Walter

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
M. Decker

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jutta Poteat

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jeanette Galitsky

Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jerry Bloomer

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jenny Garden

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Chris Seaton

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Ben Liles, Ph. D.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
kevin dewald

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;

- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Edward Waxman

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Judi Travis

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Janine Kondreck

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Robert Winters

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Darryl Johnson

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Eleanor Beram

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Todd Sargent

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Joseph Stein

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Candiann Roswell

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Jean Gore

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;

- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Gerald Lawrence

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;

Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
darynne jessler

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Nikki Scaduto

With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
- federal lands are necessary locations and special or sensitive public lands are avoided altogether: agencies should continue analyzing impacts to special public lands and moving corridors to avoid them. The agencies should use analysis provided by conservation groups to move corridors out of special places like Grand Staircase-Escalante National Monument and the dozens of other outstanding units which the proposed corridors would cross;
- projects are subjected to best management practices to limit damage to other resources, recreation and views: agencies should make their Interagency Operating Procedures mandatory;
- risks to federal and other affected lands are realistically and thoroughly assessed, so that those risks can then be avoided or minimized: agencies should analyze cumulative impacts to both federal lands and state, private, and tribal lands which will be impacted when the corridors are connected;

- once appropriate locations are identified, projects on federal lands are presumptively limited to those corridors: agencies should limit projects on federal lands to corridors;
- consideration is given to improving access for renewable energy, such as wind and solar: agencies should take the opportunity to reduce our dependence on fossil fuels, limit the effects of climate change and help build a sustainable energy future for the West by seriously evaluating alternatives to maximize use of renewable energy;
- avoid wild areas pending designation: wildlands included in recently-introduced wilderness bills (such as those in Oregon, Washington, Colorado, and California) will also be impacted by the proposed corridors. Analysis of such impacts has not been completed yet, but as agencies are provided with relevant information they should consider moving or modifying corridors. Wild and Scenic Rivers that have been deemed eligible or suitable for designation should also be avoided; and
- alternatives are presented and considered: without alternatives, the public can only comment on what they don't like about the proposed plan. The agencies (who have all of the pertinent information) should provide the public with choices - that's why NEPA requires them to develop alternatives.

By adopting the changes above, the agencies can guarantee the protection of our priceless publicly-owned wildlands and ensure a sustainable, clean energy future for all Americans.
Thank you.

Sincerely,
Dianne Andis

West-wide Energy Corridor DEIS
Argonne National Laboratory
9700 S. Cass Ave., Building 900, Mail Stop 4
Argonne, IL 60439

Subject: West-wide Energy Corridor

Dear Argonne National Labs:

The proposed designations in the Department of Energy's Draft Programmatic EIS (PEIS) will have significant impacts to wildlife habitat, cultural resources, recreation opportunities, and many other resources on federal lands across the west. Once designated, the corridors will cover 6,000 miles and almost 3 million acres of public lands. With large-scale buildup likely within these corridors, public involvement in the planning process is crucial to ensure that the designation of these corridors is a positive step for our public lands.

By taking the responsibility to move forward with a process to designate large swaths of our federal lands as places for oil, gas and hydrogen pipelines, and power lines, the government also took on the responsibility of doing it right. This would involve ensuring that:

- new pipelines or powerlines are actually needed: agencies should analyze the potential to meet growing energy demands through increased energy efficiency, distributed generation and maximizing the use of the existing power grid through technology upgrades before turning to additional or wider corridors on our public land;
